A Project Report On

E-commerce Website

Submitted to:

Department of Computer Application

Pascal National College

In partial fulfillment of the requirements for the Bachelors in Computer Application

Submitted by:

Rajeshan Maharjan| 6-2-1226-19-2021

Sitif Napit | 6-2-1226-25-2021

Faculty of Humanities and Social Science

Pascal National College

Supervisor's Recommendation

I hereby recommend that this project prepared under my supervision by Rajeshan Maharjan and Sitif Napit entitled "E-Commerce" in partial fulfillment of the requirements for the degree of Bachelor of Computer Application is recommended for the final evaluation.

Kabindra Koirala

Project Supervisor

BCA Department

Pascal National College, Lalitpur

Tribhuvan University

Faculty of Humanities and Social Science

Pascal National College

Letter of Approval

This is to certify that this project prepared by Rajeshan Maharjan and Sitif Napit entitled "**E-Commerce**" in partial fulfillment of the requirements for the degree of Bachelor in Computer Application has been evaluated. In our opinion it is satisfactory in the scope and quality as a project for the required degree.

SIGNATURE of Supervisor	**SIGNATURE of HOD/ Coordinator**
SIGNATURE of Internal Examiner	**SIGNATURE of External Examiner External**

ABSTRACT

E-commerce has revolutionized the way we shop and do business, transforming traditional retail into a dynamic and interconnected global marketplace. With the click of a button, consumers can browse a vast array of products and services, compare prices, read reviews, and make purchases from the comfort of their homes or on the go. E-commerce is a website where shopping meets convenience and quality meets affordability! As your go-to online marketplace, we pride ourselves on offering a diverse range of products that fulfills the needs and demands for every PC enthusiastic users. Our user-friendly interface and product information ensure you can make informed decisions with confidence.

Water methodology is implemented for this system that includes a series of starting with requirement analysis, design, implementation and testing. Requirement analysis is used to require essential information about how the system is implementing its requirements like functional, non-functional. Design phase consists of how the information is transformed into system design specifications. It can be illustrated using various tools. Implementation phase is implemented through various programming languages and testing is done.

ACKNOWLEDGEMENT

We would like to express our special thanks of gratitude to our supervisor **Mr. Kabrindra Koirala** who gave us the golden opportunity to do this wonderful project on the topic of e-commerce, which also helped us in doing a lot of research and we came to know about so many new tools and technologies.

We would like to express our special thanks to our College Principal **Mr. Ashok Kumar Panth** who gave us permission for doing this project.

I am highly indebted to **Pascal National College** for their guidance and constant supervision as well as for providing necessary information regarding the Project and support in the completion. We would also like to thank our parents and friends who helped us a lot in finalizing this project within the limited time frame.

In the end, we would also like to thank Tribhuvan University for giving us this opportunity via the course of Computer Application to help us understand the project ethics at this early stage and helped us to evaluate my knowledge and expand it a little more.

Yours sincerely,

Rajeshan Maharjan

Sitif Napit

Chapter 1: Introduction

1.1 Introduction

E-commerce is a modern business methodology that address the needs of the organization, merchants and customers to cut or reduce costs while improving the quality of goods and services increasing the speed of service delivery. E-commerce, shorts for electronic commerce, represents to associated with buying and selling of goods and services, or the transmitting of the funds or data, over a digital electronic network, primarily the internet. E-commerce is fast gaining around as an accepted and used business paradigm. More and more business houses are implementing websites providing functionality for performing commercial transactions over web. It is a reasonable to say that the process of shopping on the web is becoming common place.

Generally, we all involved in business in our daily life, we buy our goods and sell also. Traditional process of buying and selling is very difficult and time consuming. In recent years, the global marketplace has witnessed an unexpected shift towards online truncations, driven by technology advancements changing consumer behaviour, and the pursuit of efficiency. The emergence and adaptation of e-commerce by customers as well as business enterprises, there is, has been and will always be a concern regarding the e-commerce security i.e., how secure it is to perform transactions and operations through e-commerce.

E-commerce is a virtual store on the internet where customers can browse the catalogue and select products of interest. The selected items may be collected in a shopping cart. At checkout time, the items in the shopping cart will be presented as a order. At that time, the items in the shopping cart will be presented as an order. At that time, more information will be needed to complete the transaction. Usually, the customer will be asked to fill or select a billing address, a shipping option and payment information such as Cash on Delivery.

1.2 Problem Statement

E-commerce in Nepal encounters a spectrum of challenges that hinder its robust development. One significant barrier is the limited accessibility to high-speed internet, particularly in remote areas, constraining the potential user base and hindering the seamless adoption of online truncations. This digital divide exacerbates disparities in e-commerce participation across the country

Another critical challenge lies in the payment infrastructure. The dearth of secure and diverse online payment option poses a considerable hurdle for both security of financial information, contribute to a hesitancy among potential users to engage in e-commerce activities. Establishing a reliable and secure payment ecosystem is crucial to building confidence among users and fostering the growth of online commerce.

Furthermore, logistical and infrastructural bottlenecks add complexity to the e-commerce landscape In Nepal. Inadequate transportation and delivery systems, particularly in geographically challenging regions, lead to delays and increased operational costs. These logistical challenges impact the efficiency of supply chains and consequently the overall customer experience. Addressing these issues, along with improving digital literacy and establishing a clear regulatory framework, is imperative for sustainable advancement of e-commerce in Nepal.

1.3 Objectives

- To develop a system that helps to create and manage products.
- To develop a system that consists of functionalities like purchase products, view detail

1.4 Scope

- Set competitive prices to attract cost-conscious buyers
- Provide user-friendly interface
- Establish responsive customer support channels to address queries, concerns and ensure customer satisfaction

1.5 Limitations

- No QR Scan Feature for payment system at the moment.
- More visual representations of the system like videos

1.6 Report Organization

Introduction

This chapter deals with the introduction of the system with its objectives and limitations along with the reason why the system is made.

Background Study and Literature Review

This chapter summarizes the work that has been carried out in the field of e-commerce website and also describes the features about some existing applications related to the E-commerce website.

System Analysis and Design

This chapter focuses on the different requirements of the system, which describes the functional, non-functional, feasibility analysis, Entity Relational diagram, Data Flow Diagram, design of the system with system architecture, database schema, and interface design.

Implementation and Testing

This chapter emphasizes tools used in system development, implementing details and results of test performed.

Conclusion and Future Recommendation

This chapter highlights a brief summary of lessons learnt, outcome and conclusion of the whole project and explains what has been done and what further improvements could be done.

Chapter 2: Background Study and Literature Review

2.1 Background Study

Online shopping was invented by entrepreneur Michael Aldrich in the United Kingdom in 1979. Aldrich was the first one to create a multi-user transaction via a computer and a telephone line. The system was marketed in 1980 and was sold across Europe to B2B businesses.

Cross-border e-Commerce is also an essential field for e-Commerce businesses. It has responded to the trend of globalization. It shows that numerous firms have opened up new businesses, expanded new markets, and overcome trade barriers; more and more enterprises have started exploring the cross-border cooperation field. In addition, compared with traditional cross-border trade, the information on cross-border e-commerce is more concealed. In the era of globalization, cross-border e-commerce for inter-firm companies means the activities, interactions, or social relations of two or more e-commerce enterprises. However, the success of cross-border e-commerce promotes the development of small and medium-sized firms, and it has finally become a new transaction mode. It has helped the companies solve financial problems and realize the reasonable allocation of resources field. SMEs (small and medium enterprises) can also precisely match the demand and supply in the market, having the industrial chain majorization and creating more revenues for companies.

2.2 Literature Review

About 40 years ago E-commerce was introduced. The term was first employed and coined by Dr.Robert Jacobson. Since then, E-commerce has helped number of businesses grow by using latest technologies and much improvements in internet connections, added secure payment gateways, and widely business and consumer adoption. [1]

E-commerce has the capability to integrate all inter-company and intra-company functions, meaning that the three flows (physical flow, financial flow and information flow) of the supply chain could be also affected by e-commerce. The affections on physical flows improved the way of product and inventory movement level for companies. For the information flows, e-commerce optimized the capacity of information processing than companies used to have, and for the financial flows, e-commerce allows companies to have more efficient payment and settlement solutions. [2]

Electronic commerce can be classified into two categories. The first category is business based on types of goods sold (involves everything from ordering "digital" content for immediate online consumption, to ordering conventional goods and services, to "meta" services to facilitate other types of electronic commerce). The second category is based on the nature of the participant (B2B, B2C, C2B and C2C).[3]

Chapter 3: System analysis and Design

3.1 System analysis

This project will be done by using the Waterfall Model with additional development. It includes a series of starting with requirement analysis, design, implementation and testing. During requirement analysis, all the functional and nonfunctional requirements are analyzed and the system is developed according to the requirement then designing of the system is carried out. After the design process, implementation as well as coding and development part is started. Then after integrating the system the testing part is done.

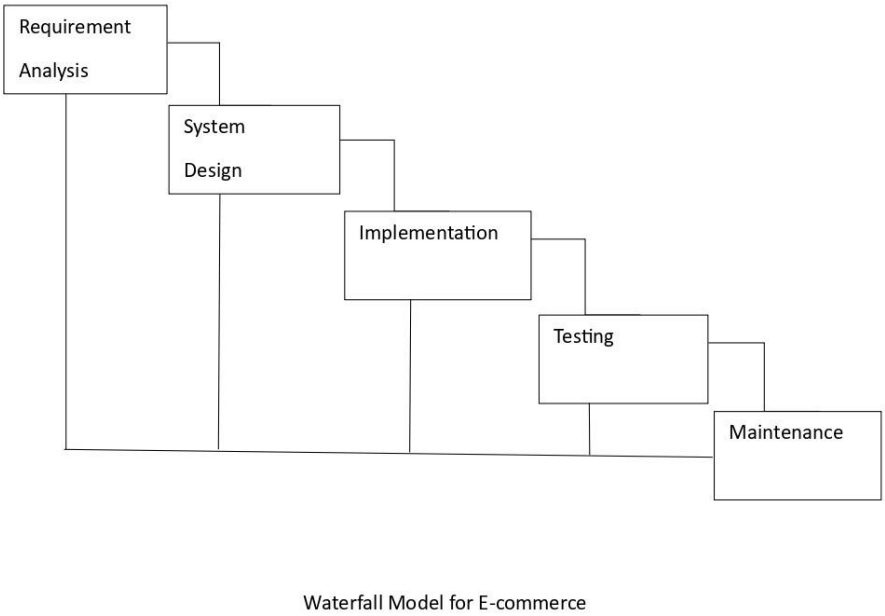

Figure 0-1: Waterfall Model

3.1.1 Requirement Analysis

I. Functional Requirement

These requirements are what of your website i.e. it includes the functions and core operations of the banking system which lets the users interact with the website. These are tangible, easy to quantify and understand, and typically define the behavior of a system based on user interactions. The system should provide following functionalities:

- Users should be able to register online while providing necessary information.
- Users should be able to create and manage their accounts.
- Users should be able to sign in with passwords.
- The system should support functions like search product, add to cart and buy now
- Admin should be able to manage and authenticate customer information and manage stocks of the product.

II. Non-functional Requirement

It describes the general properties of a system. They are among the most important things to define when building the specification for an e-commerce platform, as most have a direct impact on the experience and satisfaction of your users. Here are some basic types of nonfunctional requirements:

- The system should be available 24 hours of the time.
- The system should be compatible with the latest version of popular browsers, including Opera, Chrome and Edge.
- The system should be able to handle multi-user connections during running hours.
- Users should be able access their account after successful authentication.

3.1.2 Feasibility Analysis

Feasibility is the study of impact, which happens in the organization by the development of a system. The impact can be either positive or negative. When the positives nominate the negatives, then the system is considered feasible. Here the feasibility study can be performed in three ways such as technical feasibility, operational feasibility, economical feasibility and schedule feasibility.

I. Technical

It is technical feasible, since there will not be much difficulty in getting required resources for the development and maintaining the system as well. The project is being built by using simple technologies to reduce technological hindrance. The project is written on VS code editor.

II. Operational

The project ensures user-friendly access with simple design and seamless integration into existing e-commerce website. The system supports scalability to accommodate future growths.

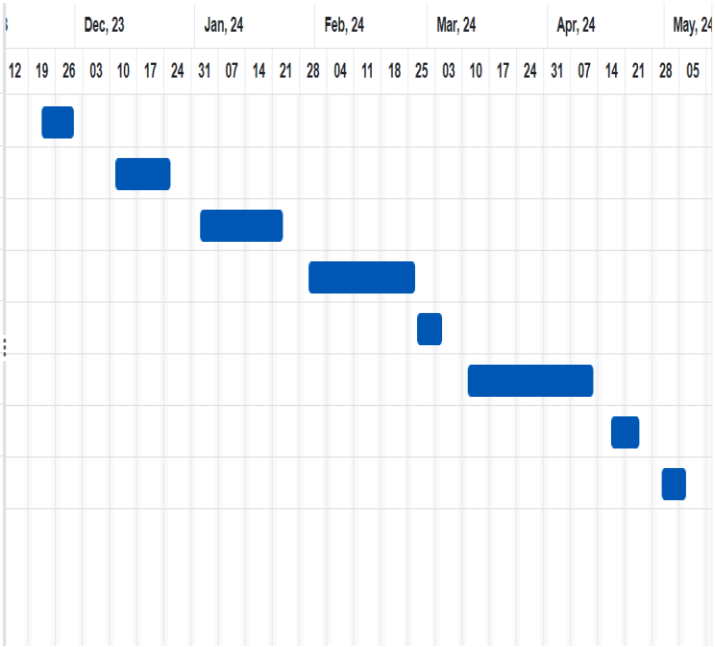
III. Economic

Development of this application is highly economically feasible. We didn't spend that much money for its development. The only thing to be done is making an environment for the development with effective supervision.

IV. Schedule

This includes the project schedule and all time allocated for their completion. The Gantt chart is as follows:

Name	ID	Start Date	End Date	Duration
Research and Planning	1	Nov 22, 2023	Nov 30, 2023	7 days
Requirement Gathering	2	Dec 11, 2023	Dec 25, 2023	11 days
System Design	3	Jan 02, 2024	Jan 23, 2024	16 days
Development Phase 1	4	Jan 30, 2024	Feb 26, 2024	20 days
Review	5	Feb 27, 2024	Mar 04, 2024	5 days
Development Phase 2	6	Mar 11, 2024	Apr 12, 2024	25 days
Review	7	Apr 17, 2024	Apr 24, 2024	6 days
Testing	8	Apr 30, 2024	May 06, 2024	5 days



3.1.3 Data Modeling (ER diagram)

A data model is a mechanism that provides abstraction for database application. Data models define how data is connected to each other and how they are processed and stored in a system. There are different data models which are used to design and develop the database, but here we use ER (Entity Relationship) Model. E-R Model is a popular high level conceptual data model that consists of a collection of basic objects called entities and relationships among these objects. The ER diagram of online banking system is as shown below:

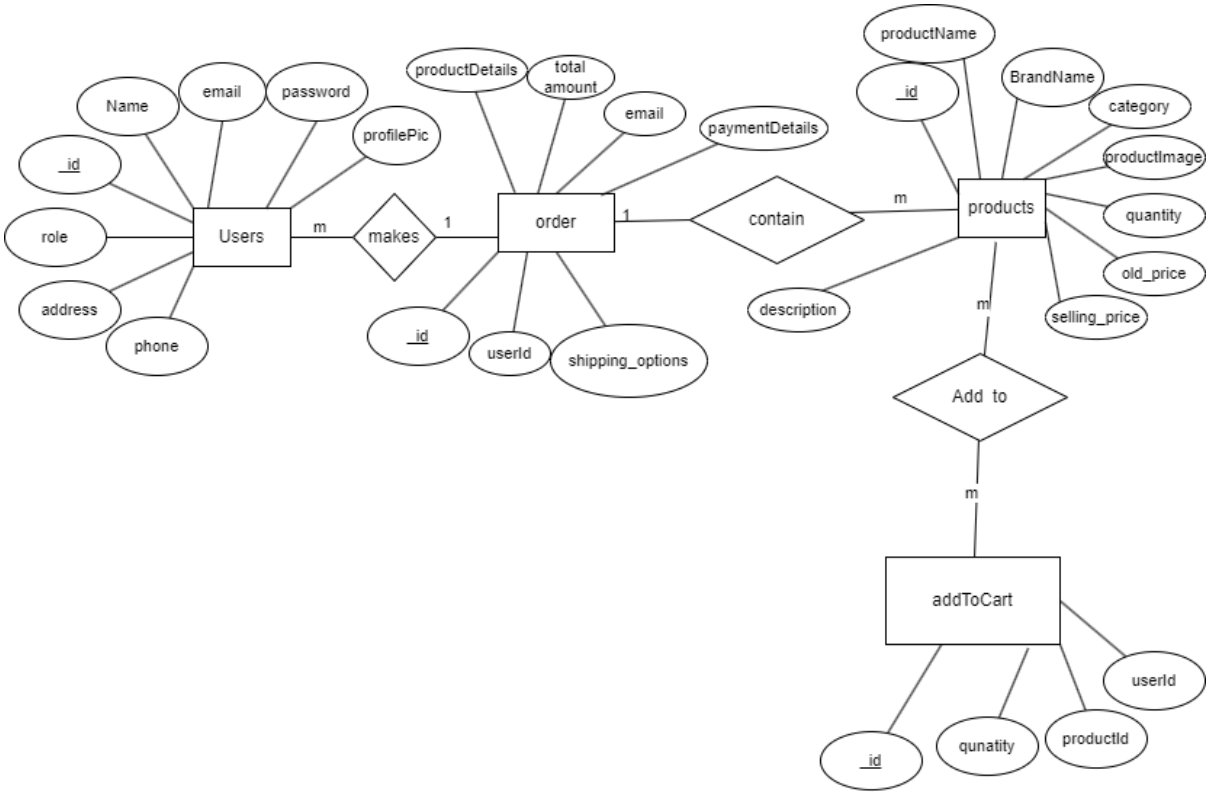


Figure 0-2.1.3: ER-Diagram of E-commerce website

There are four entities for e-commerce webiste: User, Order, Products and addToCart. The User table has attributes like user_id which is the primary key for the user table with data type int and other attributes like name, address, phone, Email, password, profilepic, role. Similarly in the next table Order it contains primary key _id as int data type and other attributes like productDetails,TotalAmount, ameial, paymentDetail, userID, shipping_option. Products table contains primary key id as int data type and other entities like productName, BrandName, category, productImage, quantity, desciption, old_price, selling_price. addToCart table contains primary key _id and other attributes like quantity, productId, userId. Users and Orders with a crow's foot notation signifies a "one-to-many" relationship. A single User can place many Orders, but an Order belongs to only one User. 3.1.4 Process Modeling (DFD)

A DFD can be referred to as a Process Model. A data-flow diagram (DFD) is a graphical representation of the "flow" of data through an information system. A data flow diagram (DFD) is a significant modeling technique for analyzing and constructing information processes illustrates this flow of information in a process based on the inputs and outputs. Initially a context diagram is drawn, which is a simple representation of the entire system under investigation. This is followed by a level 1 diagram; which provides an overview of the major functional areas of the business.

Context Diagram

This diagram shows the system in a single process within the external entities.

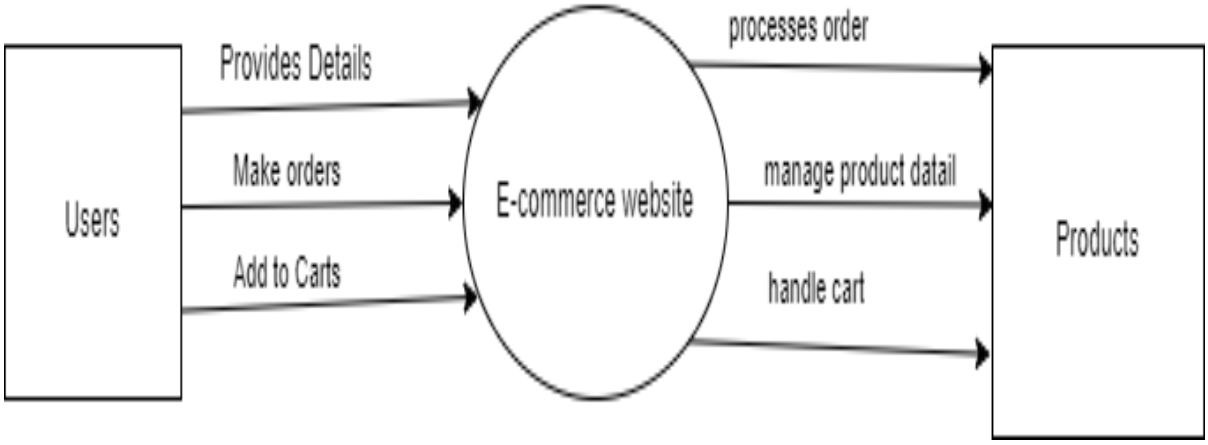

Figure 3.1.0-3: Context or Zero level DFD

Level 1 DFD

This diagram breaks down the main processes into more detailed sub processes.

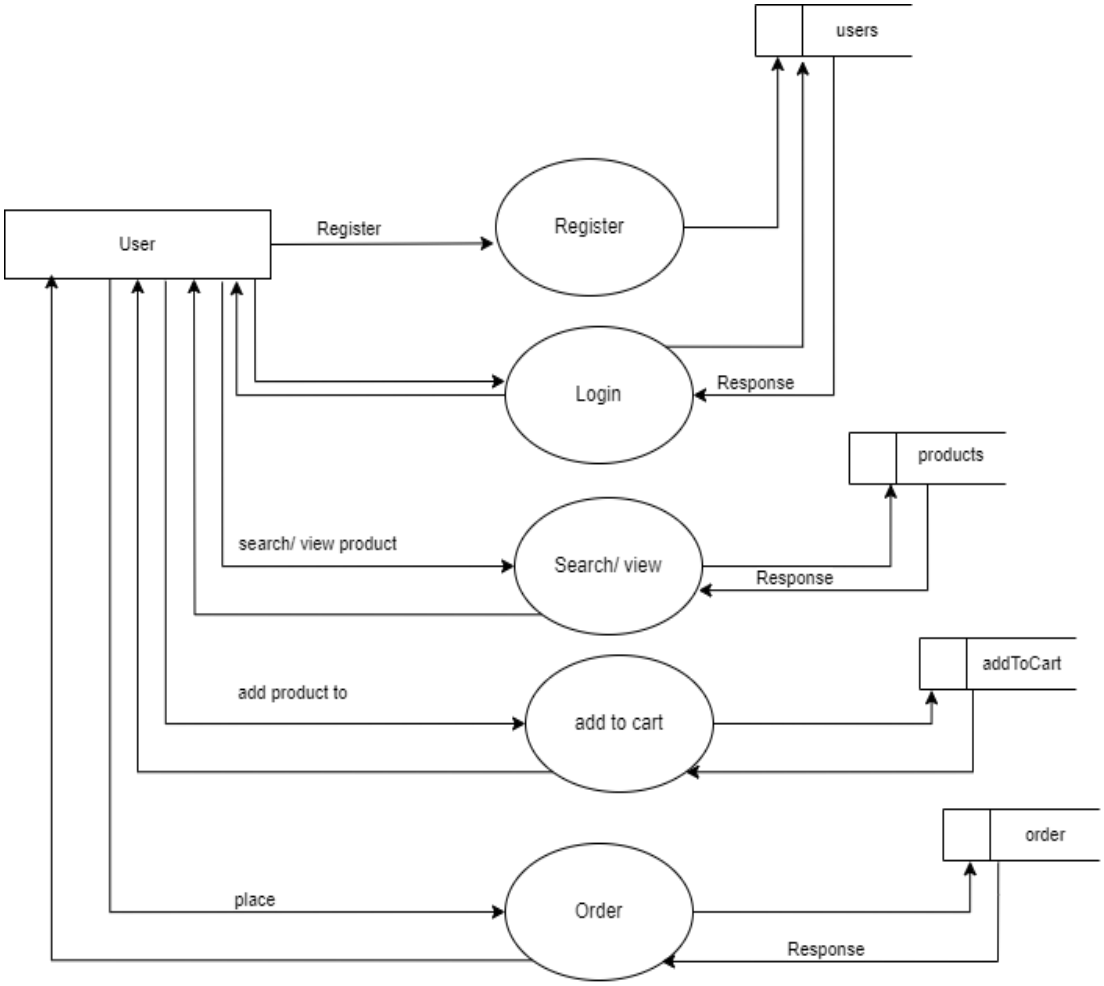

Figure 3.1.0-4: Level 1 DFD

3.2 System Design

To realize the different functional requirement of the system in graphical form, different design diagram of the systems has been prepared which are as follows:

3.2.1 Architectural Design

For this system, three tier architecture is used which includes presentation, server and database tier. In architectural design, basic structure is given.

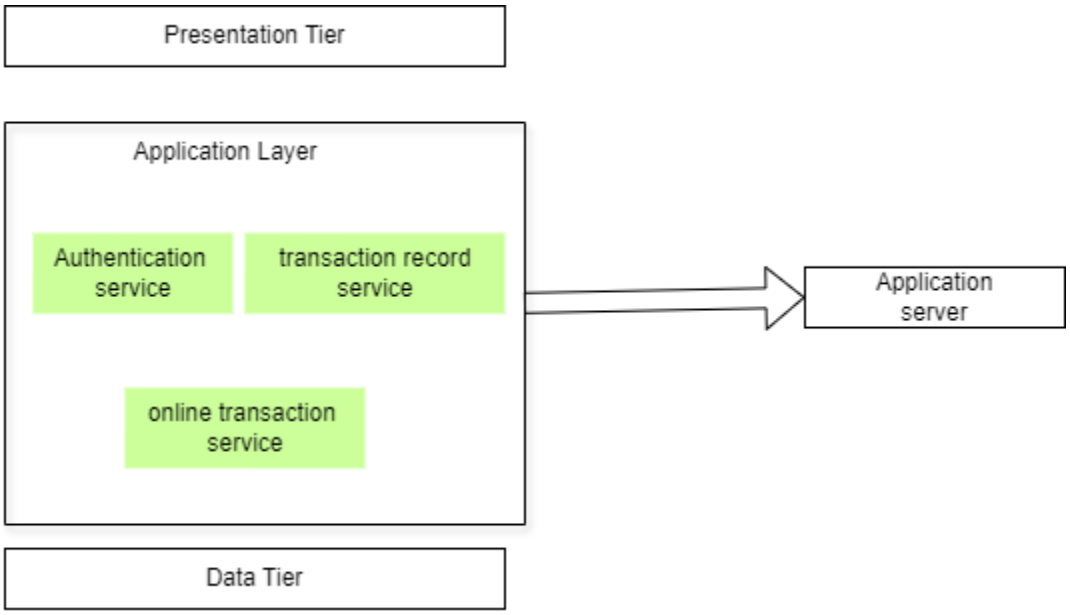

Figure 3.2.1: Architectural Design

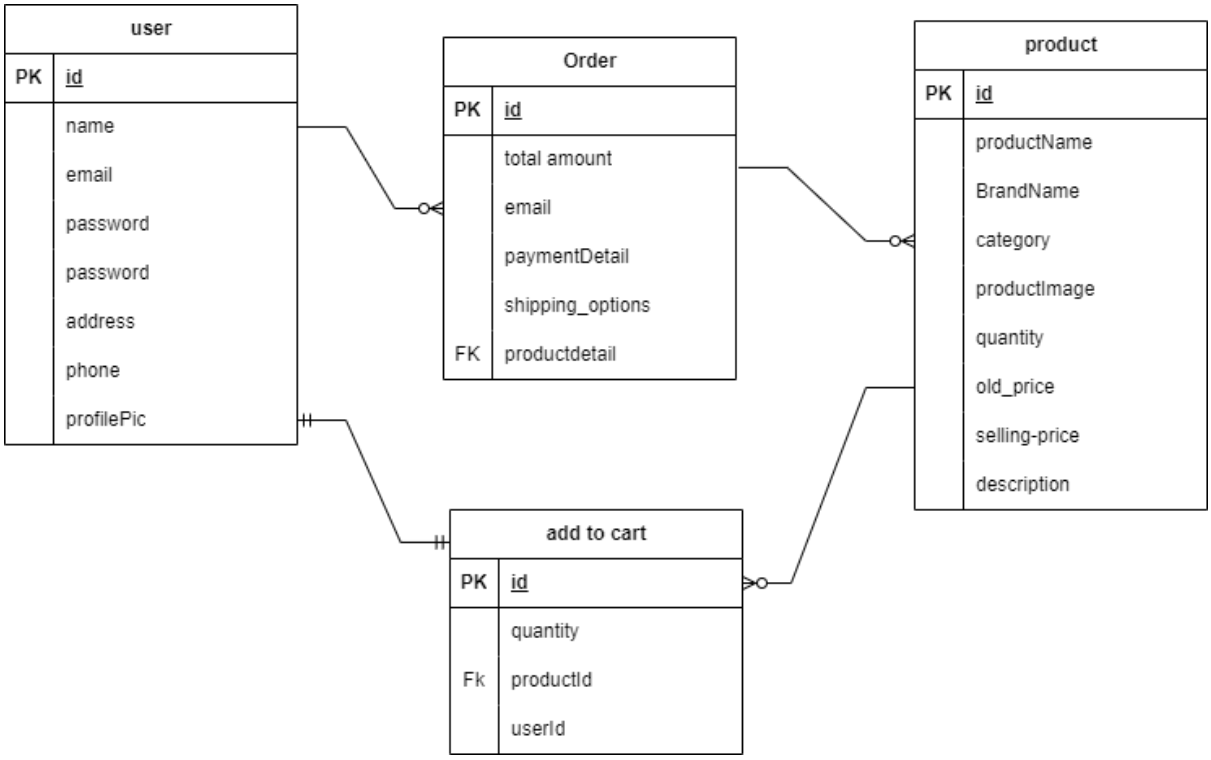
3.2.2 Database Schema Design

The database schema design for the online banking system is represented below:



``

Figure 3.2.2: Database Schema Design

In the above schema, we can figure out there are four tables in the database: User, Order, Products and addToCart. The User table has attributes like user_id which is the primary key for the user table with data type int and other attributes like name, address, phone, Email, password, profilepic, role. Similarly in the next table Order it contains primary key _id as int data type and other attributes like productDetails,TotalAmount, ameial, paymentDetail, userID, shipping_option. Products table contains primary key id as int data type and other entities like productName, BrandName, category, productImage, quantity, desciption, old_price, selling_price. addToCart table contains primary key _id and other attributes like quantity, productId, userId.

3.2.3 Interface Design

Interface design refers to the process of creating visual elements, interactions, and layouts through which users interact with a product or system. A simple wireframe of e-commerce website are represented below:

Figure 3.2.3: Dashboard

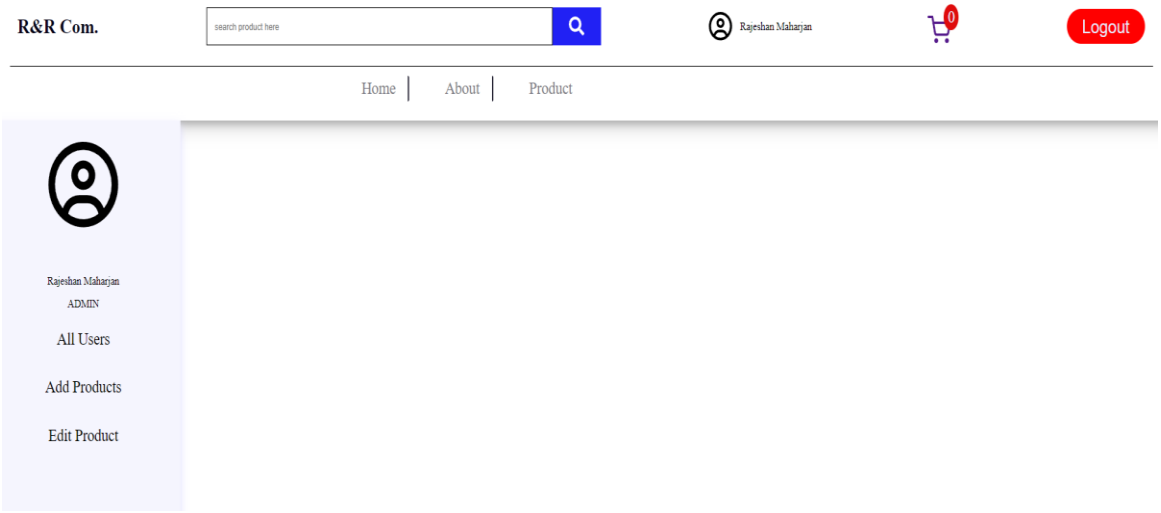


Figure 3.2.4: Wireframe for client side

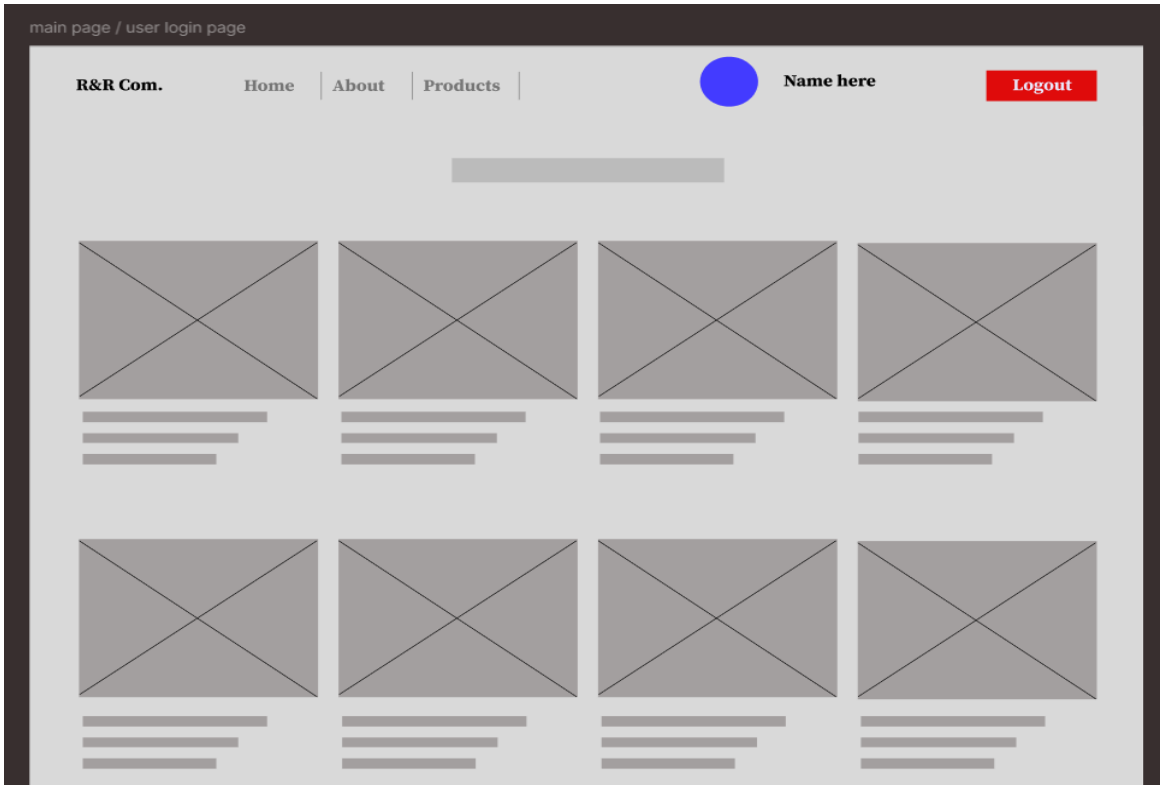

Figure 3.2.5: Wireframe for Purchase

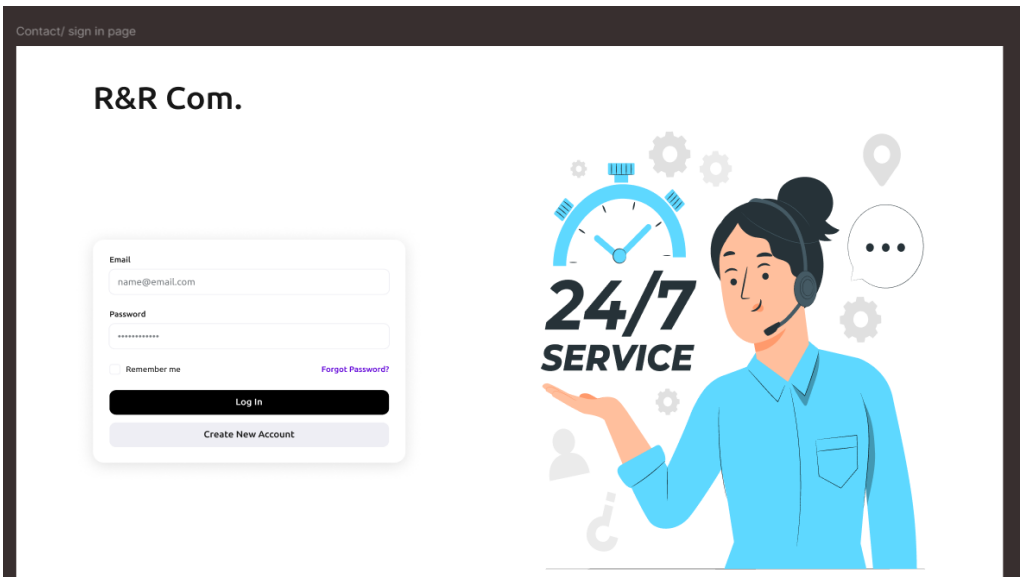
Figure 3.2.6: Login Page



Chapter 4: Implementation and Testing

4.1 Implementation

4.4.1 Tools Used

Following are the tools and framework used for accomplishment this project:

Front End Tools:

- **ReactJS**

React.js is a powerful JavaScript library primarily used for building user interfaces. Developed and maintained by Facebook, React has gained immense popularity in the web development community for several reasons.

Back End Tools:

- **NODEJs**

Node.js is a powerful runtime environment built on Chrome's V8 JavaScript engine. It allows developers to run JavaScript code outside of a web browser, making it possible to use JavaScript for server-side scripting.

Database

- **MONGODB**

MONGODB is used for storing all the information required to the database in Work Progress Tracker. It is used for perform operations such as create, delete and update data from the database as requested by the user.

Documentation Tools

- **MS Office**

We have used MS Office for writing and editing the documentation of work progress tracker.

- **Draw.io**

This is used to generate diagrams for system analysis and design of Diagrams in order to save time since all components are available with drag and drop functions.

4.4.2 Implementation of Modules

There are four major modules within the Online Banking System: User Registration, Account Management, Transactions and Admin.

1. **User Registration**

   The user authentication module handles user registration, login and logout process. User's registered with their email, password and other verifications. Login functionality for the registered users with decrypt secure hashing. Logout process exits the user from the system.

2. **Account Management**

   The account management module allows users to view their account, view products and change passwords. User can view their products and the total amount of all the products in the cart.

3. **Admin module**

   The admin module allows admin to manage user accounts in the system. Admin can also update and add the products in the database..

4.2 Testing

4.2.1 Test Cases for Unit Testing

Unit testing emphasizes the verification effort on the smallest unit of software design i.e.;a software component or module. Unit testing is performed in parallel with the coding phase. Unit testing tests units or modules not the whole software. I have tested each view/module of the application individually. As the modules were built up testing was carried out simultaneously, tracking out each and every kind of input and checking the corresponding output until module is working correctly

Registration:

Table 1: Test case for Login of an user

S.N	Test Name	Input	Expected Outcome	Actual Output	Test Results
1.	Open Application	http://localhost:5173/login	Login page	Login page	Pass
2.	Enter Invalid email	Email = rajeshanmaharjan.25 Password = Rajeshan@123	Registration Successful	Registration Failed	Pass
3.	Enter valid email, password	Email = rajeshanmaharjan.25@gmail.com Password: Rajeshan@123	Registration Successful	Registration Successful	Pass

Table 2: Test case for Login of an user

S.N	Test Name	Input	Expected Outcome	Actual Output	Test Results
1.	Open Application	http://localhost:5173/login	Login page	Login page	Pass
2.	Enter Invalid password	Email = rajeshanmaharjan.25@gmail.com Password = Rajeshan@1234	Registration Successful	Registration Failed	Pass
3.	Enter valid email, password	Email = rajeshanmaharjan.25@gmail.com Password: Rajeshan@123	Registration Successful	Registration Successful	Pass

Adding of an user:

Table 3: Test case for Registration of new user(Success)

TEST Name	User registering
Test Data	Name : Rajeshan Maharjan, email: rajeshanmaharjan.25@gamil.com, password: Rajeshan@123, confirm-password: Rajeshan@123
Expected result	Success
Test result	Success

Table 4: Test case for Registration of an user (Failure)

TEST Name	User registering
Test Data	Name : Ram Maharjan, email: rajeshanmaharjan.25@gamil.com, password: Ram@123, confirm-password: Ram@123
Expected result	Email already exists
Test result	Email already exists

Add new product :

Table 5: Test case for Adding new product

TEST Name	Upload new product
Test Data	Product Name : abc, brand Name: Acer, category: monitor, product:[abc.png, def.png, efd.png], quantity:10, price:10000, selling _price:98900, description: Best monior
Expected result	Success
Test result	Success

Table 6: Test case for Adding new product (failure)

TEST Name	Upload new product
Test Data	Product Name : abc, brand Name: Acer, category: monitor, product:[], quantity:10, price:10000, selling _price:98900, description: Best monior
Expected result	Please upload product Image
Test result	Please upload product Image

4.2.1 Test Cases for Payment of goods

TEST Name	Payment for purchase goods
Test Data	Card information : Card no. 4242 4242 4242 4242 02/26 123 Cardholder name : Customer
Expected result	Payment Successfully
Test result	Payment Successfully

Table 7: Test case for payment

4.3.1 Test Cases for System Testing

Table 8: Test Case for UI Elements

S.N	Test Name	Test Steps	Expected Outcome	Actual Output	Test Results
1.	Verify the UI elements on the dashboard page	1. Navigate to the dashboard after logging in 2. Observe the dashboard	The UI Elements should be displayed	The UI elements are displayed in the dashboard	Pass

Table 8: Test case for error handling

S.N	Test Name	Test steps	Expected Outcome	Actual Output	Test Results
1.	Verify the error handling	1. Enter an unregistered email and password in login page	Error message should be generated	Error message “Credentials do not match” is generated	Pass

Chapter 5: Conclusion and Future Recommendations

5.1 Lessons learned / Outcome

Every project makes us learn and gain knowledge in different aspects. In the following project, we have learned lots of problem-solving skills and learned things like team work, finding the solution on our own, proper use of guidelines, communication and writing skills and management of the team.

- **Teamwork**

  Since this is a team project, it teaches how to work with group members and develop the system together. We have learned how to work with a team and divide our tasks with each other and deal with the problems and errors that occur in this system.

- **Problem Solving Skills**

  From this project, we have learned lots of problem-solving skills and also learned to recognize different errors occur in this system and solve it

- **Writing Skills**

  We have learned how to prepare proposals and documentation related to projects and also learned to use different case tools for use case diagrams, schema diagrams, data flow diagrams, ER- diagrams.

- **Manage time**

  The most important lesson learnt was management of time according to the complexity of the system components i.e. know which components to prioritize.

5.2 Conclusions

After the successful completion of the project, this system will help the customers to create and manage their accounts in the system. Also this system will help the customer to get product information price with the help of this system. With the help of this project, we learned different skills like team working, technical skills, project management, problem solving as well as management of the time.

5.3 Future Recommendations

The development project could have been more efficiently handled with regards to design and development. The documentation process might have been better programming the project prior to any documentation. The system can be updated based on the user's requirements recommendation. The page load and server load speed might be improved. Some of the future recommendations are given below:

- More visual representations of the system like videos
- Add QR scan for purchase goods
- Detail Report generator can be added
